

Abstract of the Disclosure

The present invention provides a telephone device including a control unit having a call-reception history registering unit which separately sorts a call-reception history into a selected folder among a plural folders provided in a memory of the telephone device. The folders are used for storing call-reception histories according to operations to be applied thereto, for example, a rejection operation, neglecting operation, normal operation, or such.

When an incoming call arrives, the control unit measures a calling time of the incoming call and the measured calling time is compared to a pre-selected time by the calling time determining unit. According to the result to the comparison, an operation applied to the incoming call is determined. Then, the control unit sorts a call-reception history corresponding to the incoming call into a selected folder among the plural folders provided in a memory of the telephone device.
